[SOLUCIONARIO OLIVER BLANCHARD
MACROECONOMIA
EDICION.12.][BETTER] United
States Court of Appeals Fifth
Circuit F I L E D IN THE
UNITED STATES COURT OF APPEALS
February 12, 2004 FOR THE
FIFTH CIRCUIT Charles R.
Fulbruge III Clerk No.
03-40557 Summary Calendar
MOHAMMED ABDUL HASSAN,

. Solucionario Oliver
Blanchard Macroeconomia
Edicion.12 . In this problem
you may assume that the
country can produce the
particular product in any
amount and that there are no
costs of manufacturing or
transportation of the product.
These factors of production
cost nothing, there is no
input cost, and any of them
can be completely assigned any
value you like. You may
assume, for example, that the
country can always produce one
kilogram of milk, but it only

costs \$0.01 to produce one kilogram of the product. The only thing you can't assume, however, is that you may assume that some other country can always produce a product that can be converted into that kilogram of milk. I want to display information based on the list as you described here in the example. This is the code that I wrote. Do you think that the way that I have structured the code is right?

Thank you very much for your help.

```
library(dplyr) #database
creation library(RODBC)
  tabla_vendedor =
  c("PRUEBAS_FK", "pancha")
```

```
tabla_amo = c("16012", "Juan")
          tabla_tende =
            c("QUEBEC", "ALACANTE")
            #Database ##connect to
database con = odbcDriverConnect('D:\RODBC_DRIVER_sqlite.zip') ##Connect ##open database
          sql = "select * from
PRUEBAS_FK" ##Execute SQL rds1
          = dbGetQuery(con, sql) rds1 =
            as.data.frame(rds1) ##Grab
value ## Convert RDS1 to XLS
          and place in a list
library(xlsx) lista_de_puntos
          3da54e8ca3
```
